“

Pulumi is language agnostic to support multiple programming languages at the same time

[pulumi.com/docs/intro/languages](https://pulumi.com/docs/intro/languages)

[pulumi.com/docs/intro/languages](https://pulumi.com/docs/intro/languages)

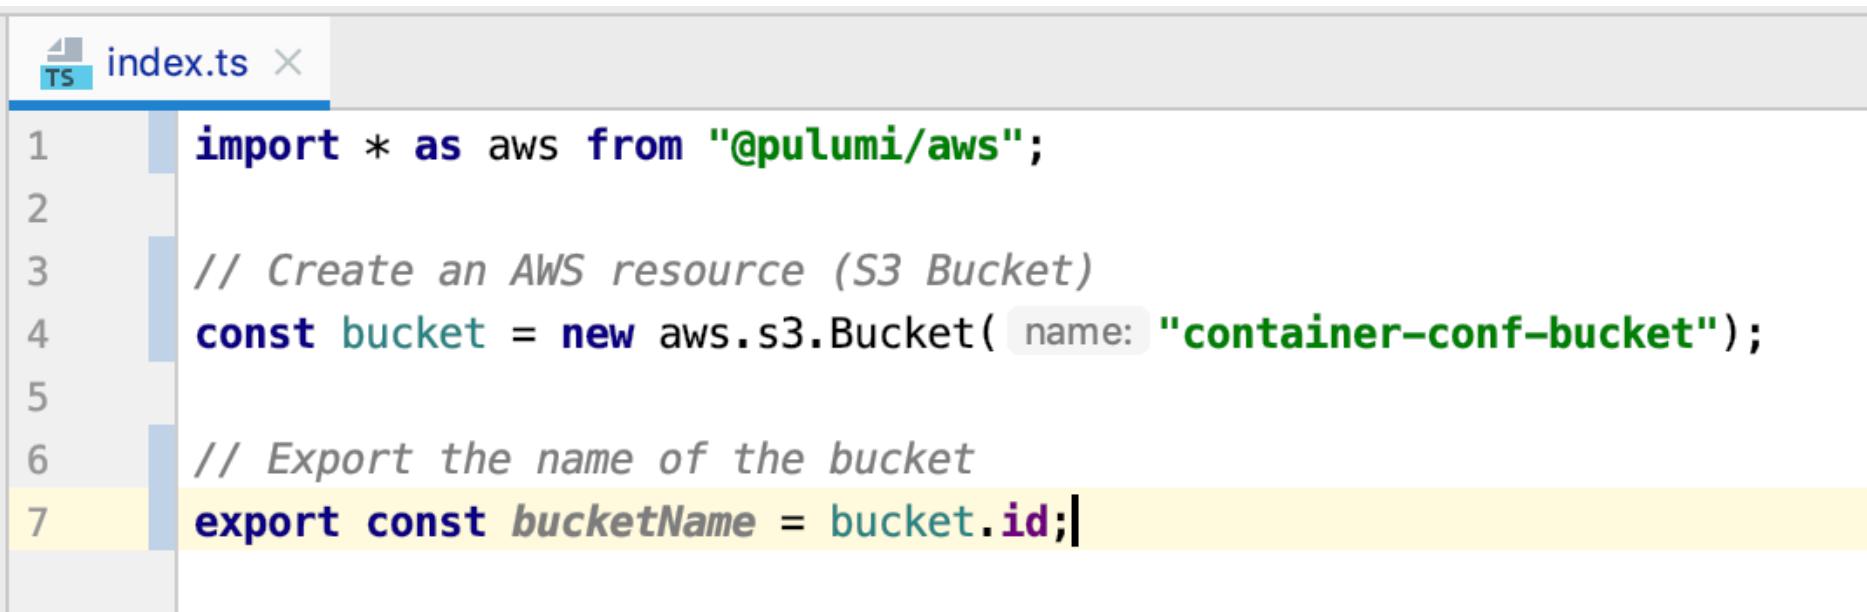

API reference: [pulumi.com/docs/reference/pkg](https://pulumi.com/docs/reference/pkg)

Examples: [github.com/pulumi/examples](https://github.com/pulumi/examples)

 <a href="#">.gitignore</a>	
 <a href="#">.travis.yml</a>	
 <a href="#">LICENSE</a>	
 <a href="#">Pulumi.dev.yaml</a>	Pulumi Stack definition
 <a href="#">Pulumi.yaml</a>	Pulumi Project config
 <a href="#">README.md</a>	
 <a href="#">index.ts</a>	Pulumi Program (TypeScript)
 <a href="#">package-lock.json</a>	
 <a href="#">package.json</a>	Node.js Package Management
 <a href="#">renovate.json</a>	
 <a href="#">tsconfig.json</a>	TypeScript config

# Pulumi program example

The screenshot shows a code editor window with a tab labeled "index.ts". The code itself is a Pulumi program:

```
1 import * as aws from "@pulumi/aws";
2
3 // Create an AWS resource (S3 Bucket)
4 const bucket = new aws.s3.Bucket({ name: "container-conf-bucket" });
5
6 // Export the name of the bucket
7 export const bucketName = bucket.id;
```

The code uses the `@pulumi/aws` package to create an S3 Bucket named "container-conf-bucket". It then exports the bucket's ID as `bucketName`. The code editor highlights the file extension ".ts" and the word "TS" in the tab bar.

# Create projects

```
~/dev > mkdir containerconf && cd containerconf  
~/dev/containerconf > pulumi new aws-typescript
```

# Multicloud?

Google Cloud Platform

Resource Providers  
aka  
„Terraform Wrappers“

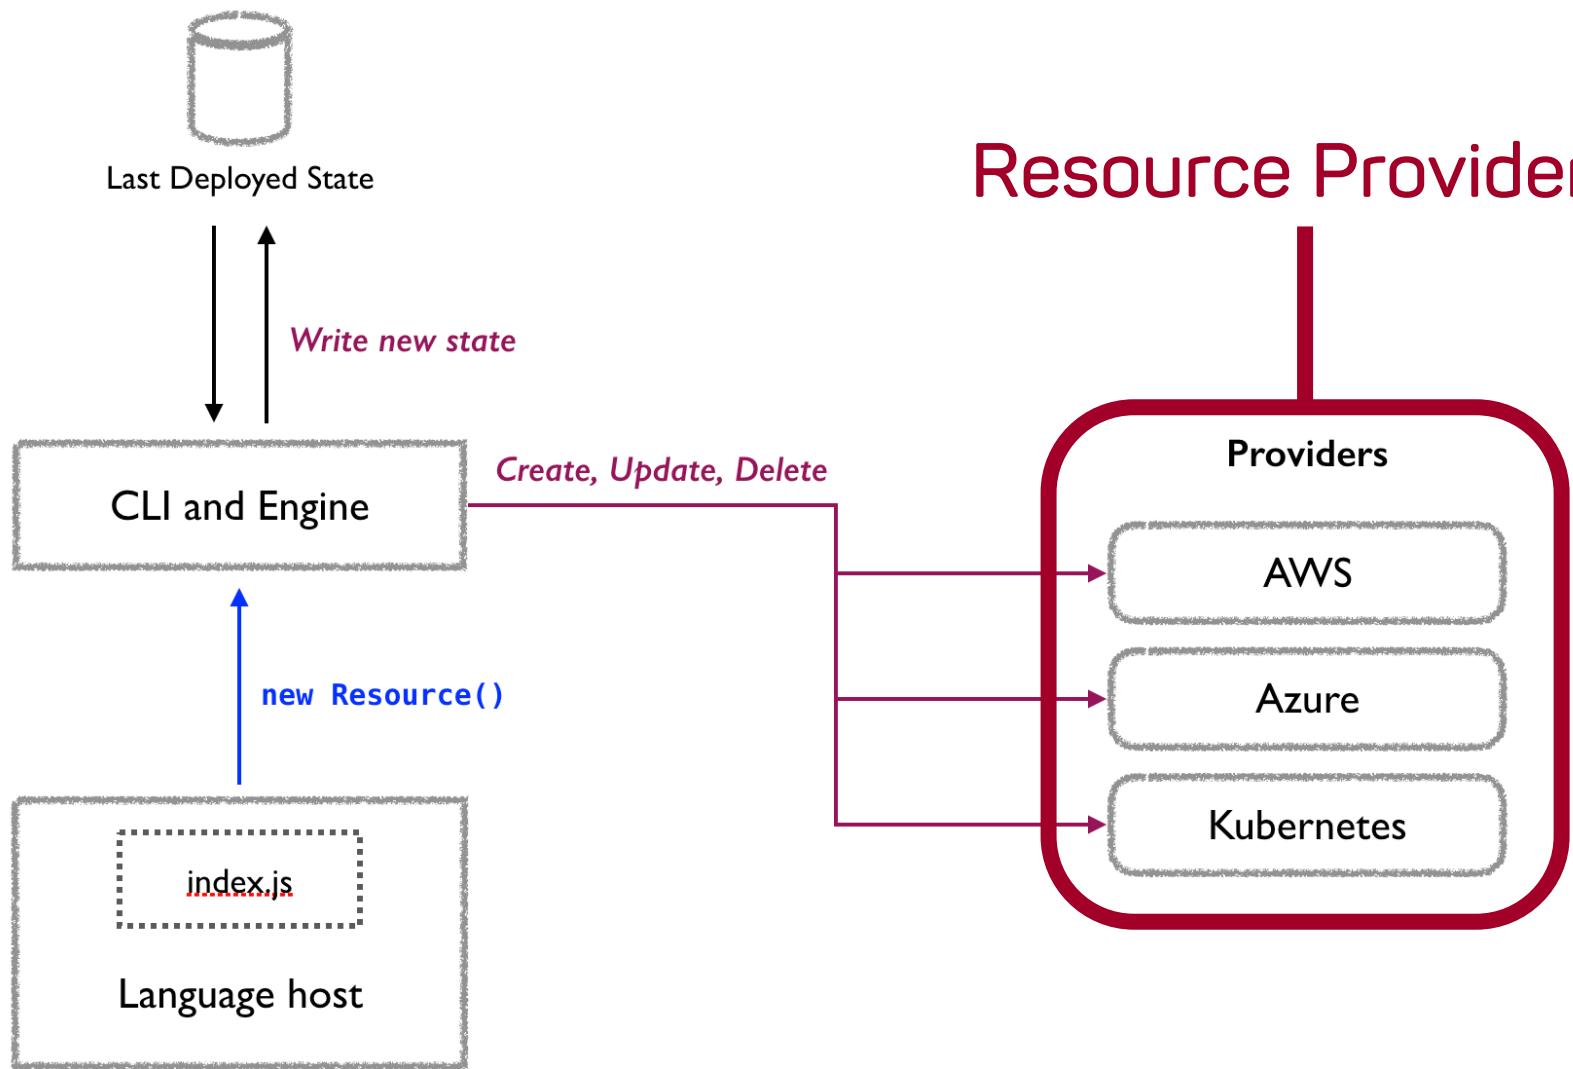

[Docs](#) / [Reference](#) / [API](#) / [@pulumi/aws](#) / [elasticsearch](#)

## Module elasticsearch

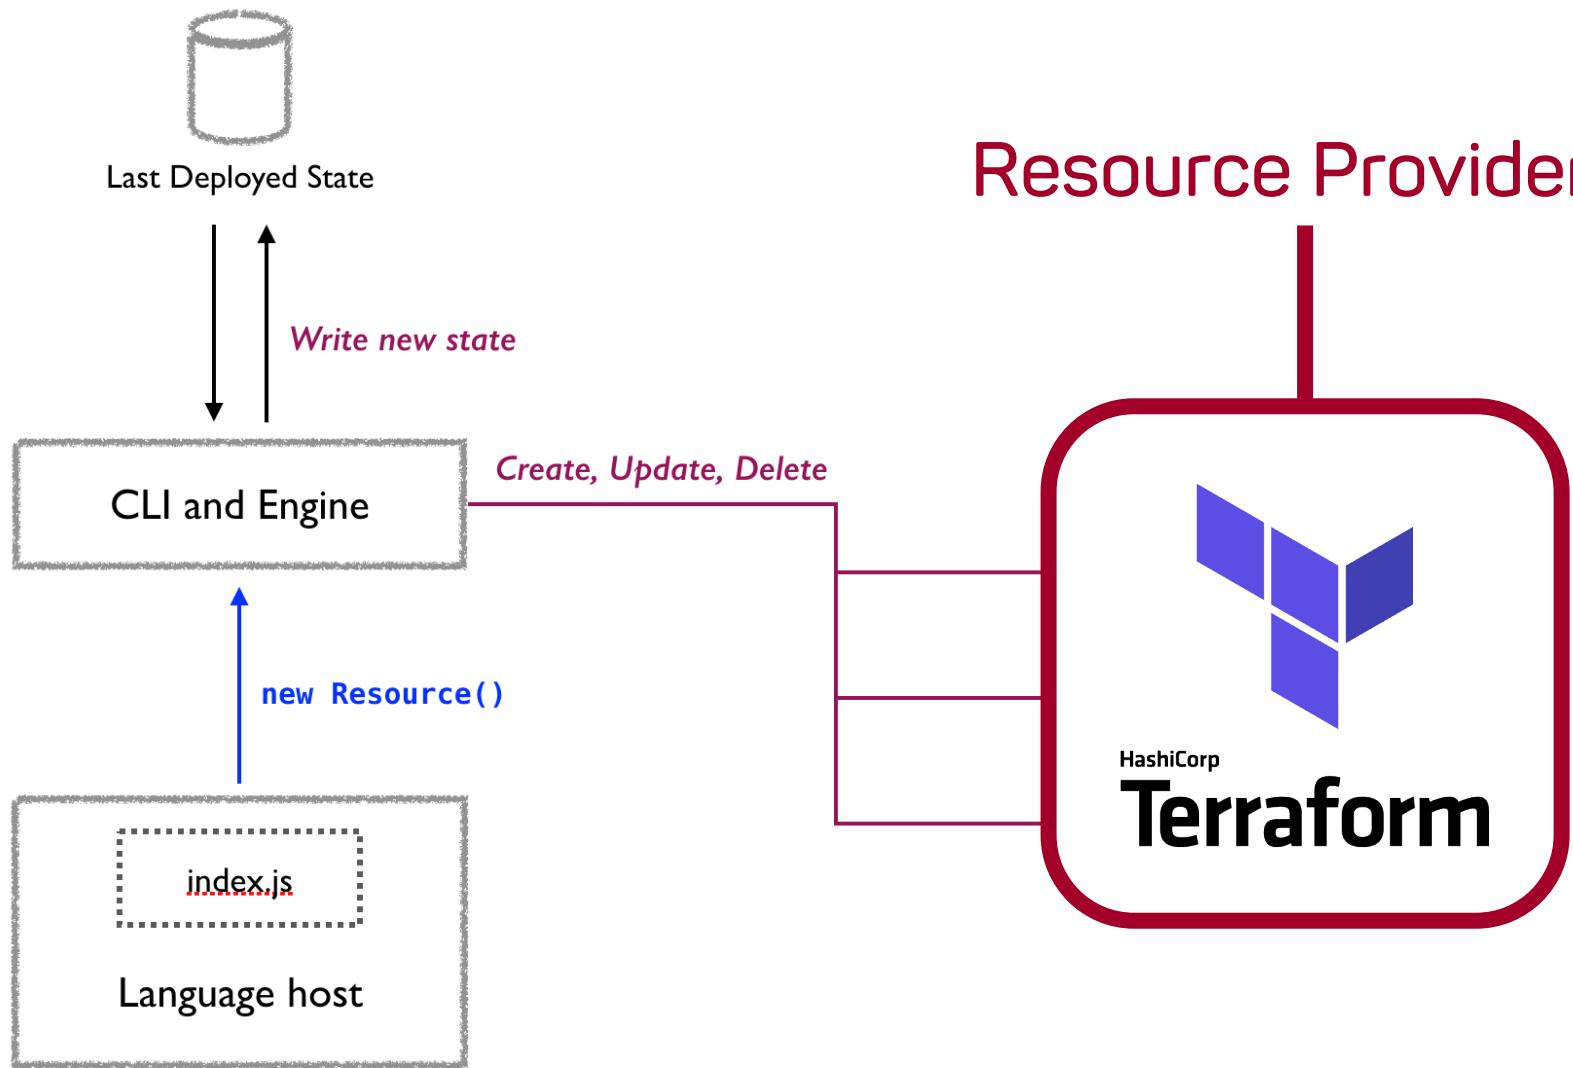

This provider is a derived work of the [Terraform Provider](#) distributed under [MPL 2.0](#). If you encounter a bug or missing feature, first check the [pulumi/pulumi-aws](#) repo; however, if that doesn't turn up anything, please consult the source [terraform-providers/terraform-provider-aws](#) repo.

# Resource Providers

= „Terraform  
Wrapper“

2019!

[pulumi.com/docs/intro/vs/terraform/#converting-from-terraform](https://pulumi.com/docs/intro/vs/terraform/#converting-from-terraform)

## M30 (December 2019)

- Custom update and delete hooks (e.g. provisioners)
- .NET Support
- Gated Deployments

## Backlog

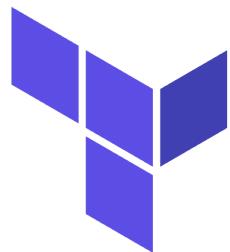

- [tf2pulumi support for Python](#)
- Complete support for Go
- Java Support
- High level libraries (like `awsx`) for Azure and GCP
- High level libraries (like `awsx`) for Python
- Overhaul `cloud` for true cross-cloud infrastructure definition
- **Native Pulumi providers for AWS/Azure/GCP**

[github.com/pulumi/pulumi/wiki/Roadmap](https://github.com/pulumi/pulumi/wiki/Roadmap)

Pulumi vs. X

SALTSTACK

HashiCorp  
**Terraform**

ANSIBLE

CloudFormation

vs.

ANSIBLE

1. Academic comparison
2. Handle configuration drift
3. Current state of my infrastructure?
4. Tools shouldn't suck! (no master!, no agents!)
5. Able to do the job! (all major Clouds & on-premise)

# 1. Academic comparison

# Configuration Management

ANSIBLE

-----

# Provisioning

HashiCorp  
**Terraform**

CloudFormation

ANSIBLE

“

Pulumi is fundamentally different  
than these tools and works great  
alongside them

[pulumi.com/docs/intro/vs/](https://pulumi.com/docs/intro/vs/)

# Configuration Management

# Provisioning

ANSIBLE

+

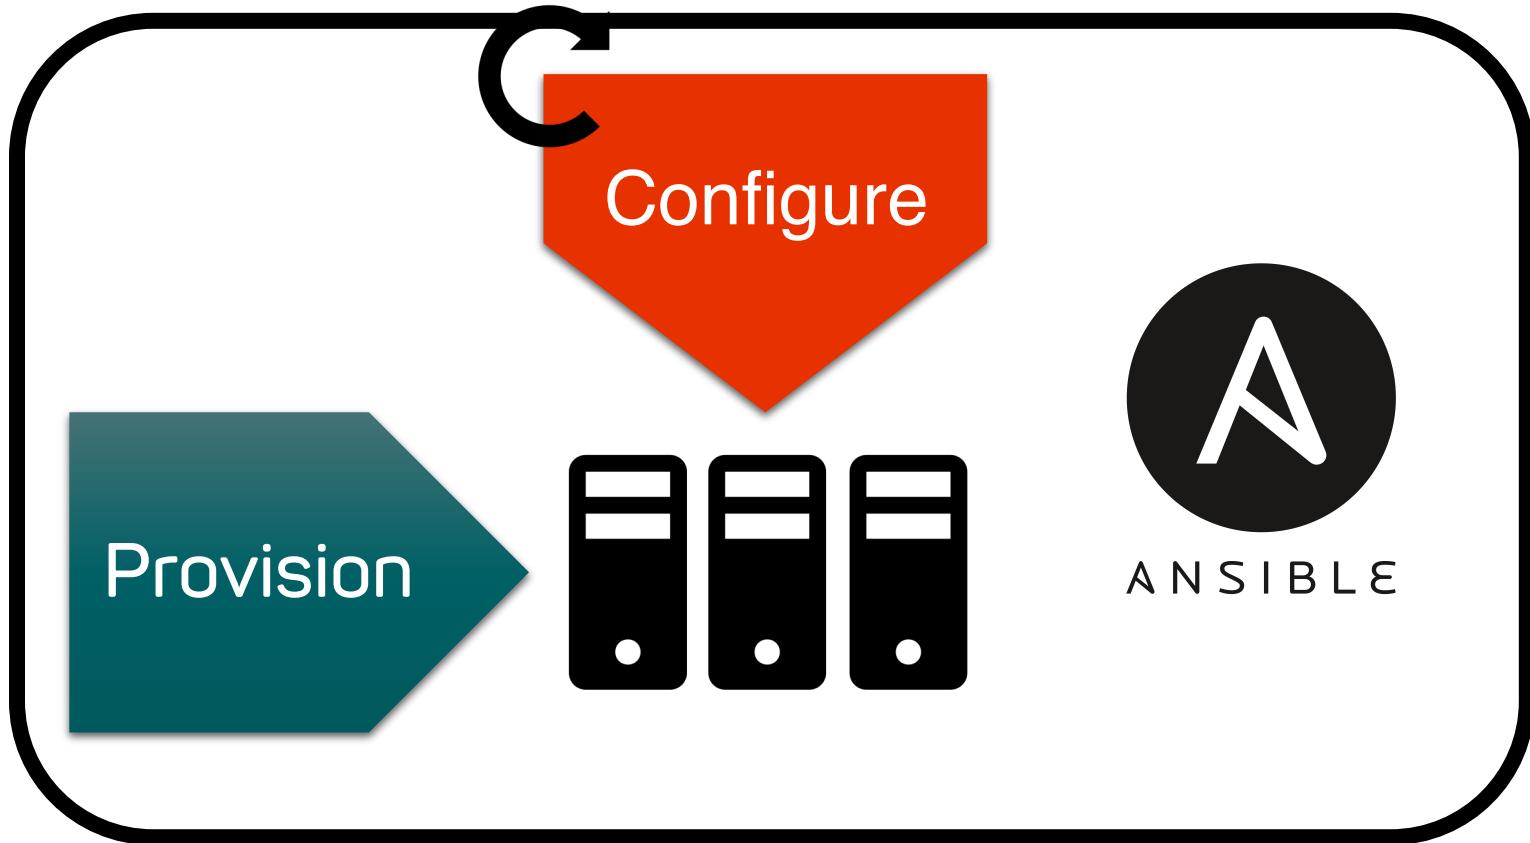

2. How do they handle configuration drift?

“

the state of the machine  
drifts from the baseline due to  
manual changes and updates

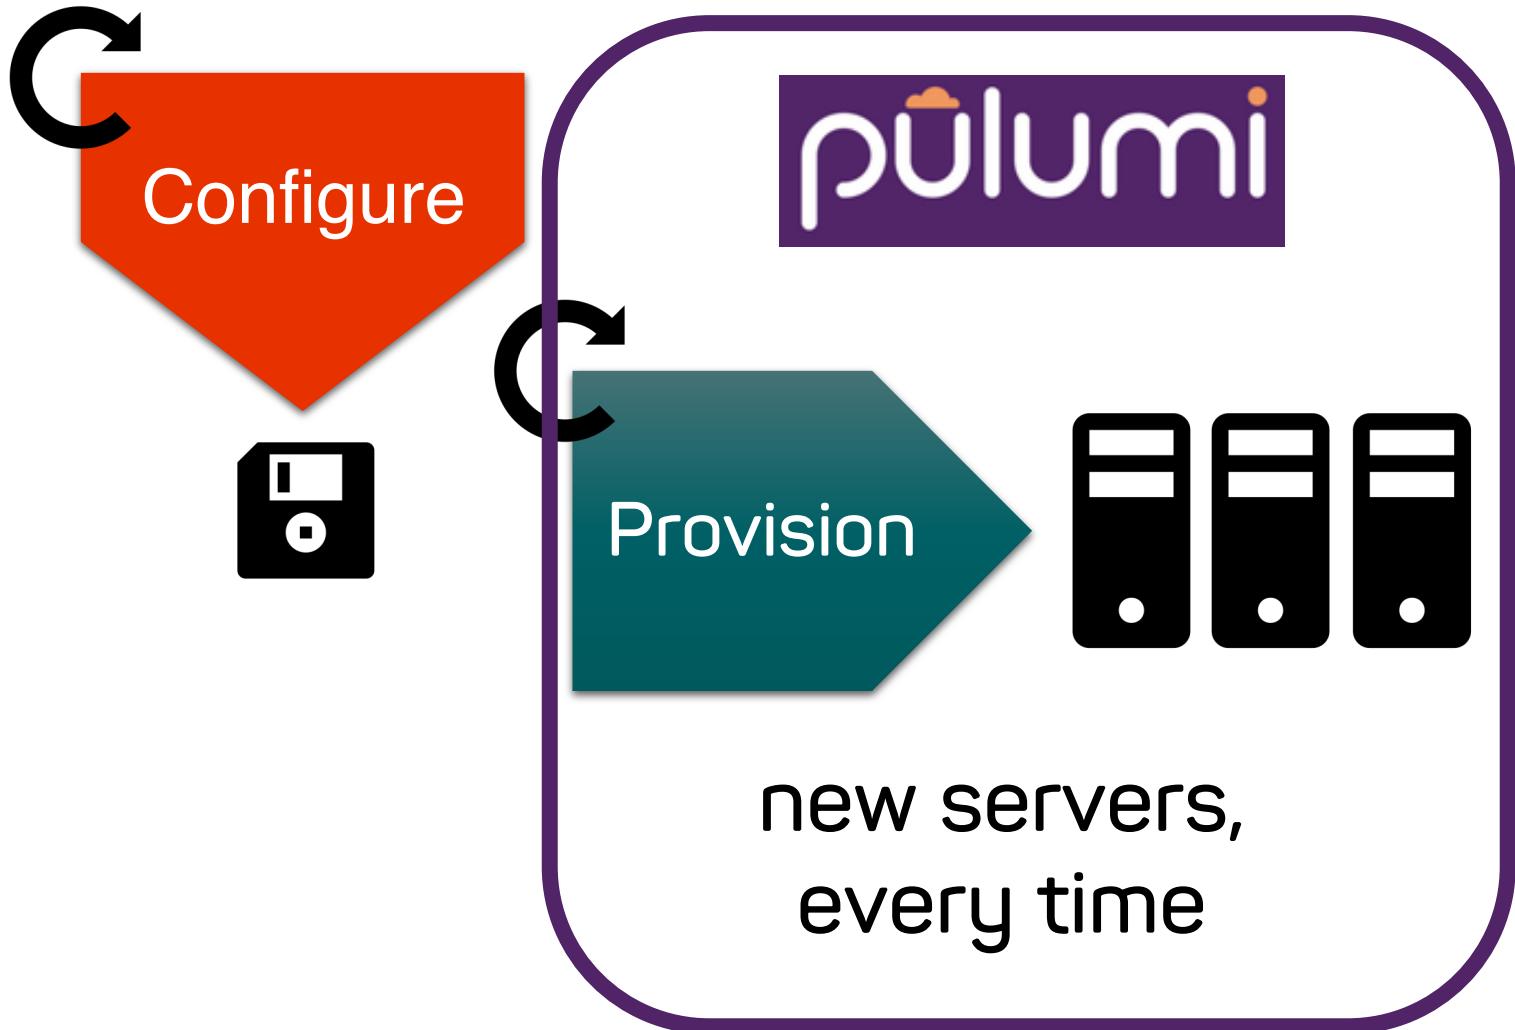

[shadow-soft.com/ansible-idempotency-configuration-drift](https://shadow-soft.com/ansible-idempotency-configuration-drift)

## Mutable Infrastructure

same servers,  
changed every time

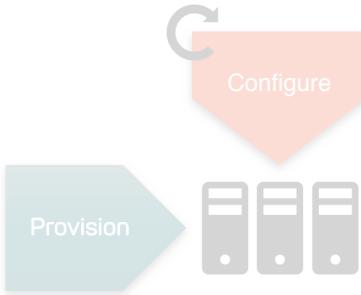

## Immutable Infrastructure

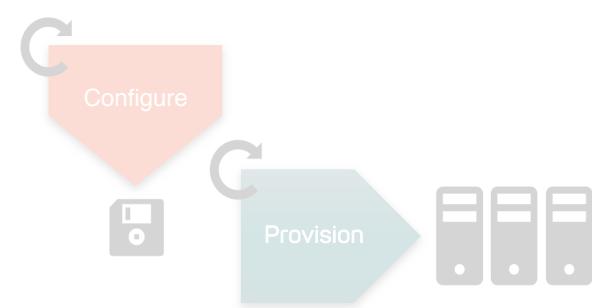

What if we don't allow „manual changes“?

Use software engineering practices  
like  
Continuous Integration  
for your infrastructure code!

## Mutable Infrastructure

## Immutable Infrastructure

Running our Infrastructure code in CI/CD pipelines, this comparison become less relevant!

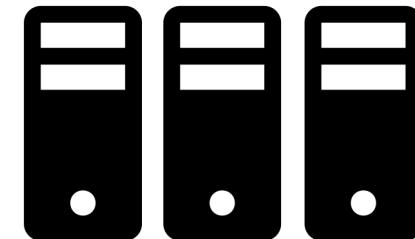

Demo time!

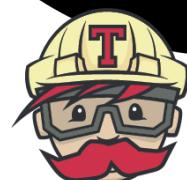

pulumi

Provision

Configure

Test

Travis CI

[github.com/jonashackt/pulumi-python-aws-ansible](https://github.com/jonashackt/pulumi-python-aws-ansible)

# 3. Current state of my infrastructure?

There's this 3rd comparison called Procedural vs.  
Declarative...

But remember the  
Continuous Integration  
thingy?

# 4. Tools shouldn't suck

(no master!, no agents!)

## master

- central place to see status of your infrastructure
- continuously enforce configuration in the background
- extra infrastructure!
- needs to be maintained
- client-2-master & master-2-servers communication needs ports & security

## no master

- 
- 
- 
- 
- 
- 
- 

Remember the  
Continuous Integration  
Thingy again?

master

# One more thing...

FOR AMAZON WEB SERVICES (AWS)

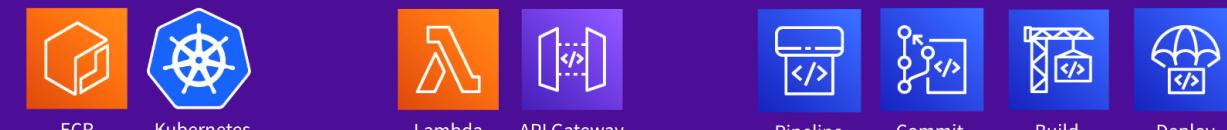

“

Crosswalk for AWS supports “day one” tasks, such as creating your initial container-based workloads using ECS/Fargate/EKS & serverless workloads (API Gateway / Lambda)

[pulumi.com/docs/guides/crosswalk/aws](https://pulumi.com/docs/guides/crosswalk/aws)

## APPLICATION DELIVERY

Go to production with containers and serverless.

Containers

Serverless

Continuous Delivery

## INFRASTRUCTURE PATTERNS

Well-Architected infrastructure for modern applications.

Security

Networking

Clusters

Monitoring

## FOUNDATION ALL OF AWS

Unopinionated infrastructure as code for all AWS resources and features.

FOR AMAZON WEB SERVICES (AWS)

# No matter what IaC tool you use...

Treat your infrastructure code  
**AS CODE!**

Use Testframeworks – or even do TDD!

Run Tests automatically - in your  
Continuous Integration Pipeline!

Run your infrastructure code frequently!  
(scheduled CI jobs)

Always aim for reproducible builds (aka  
dependency management)

Automatically update dependencies  
(e.g. renovatebot)
